```
chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. Expressed from a vector or enzymatically continuously the invention also relates to kits for the invitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TNF gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The TNF siNAs have antibacterial, immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antirheumatic, antiarthrities. They may be used for treating septic shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and autoimmune diseases. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, blarmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents a chemically modified siRNA targeted to the human TNF mRNA transcript.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC chemically synthesised, expressed from a vector or enzymatically control of synthesised. The invention also relates to kits for the in vitro or in crive delivery of siNA; conjugates and/or complexes of siNA; and vectors convive delivery of siNA; conjugates and/or complexes of siNA; and vectors control of the siNA; conjugates and/or complexes of siNA; and vectors control of the siNA; and transplants or organisms (e.g., by ex vivo gene conditions. The TNF siNAs have antibacterial, immunosuppressive, since antirheumatic, antiarthritic, anti-HIV, antipsoriatic and antiinflammatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. They may be used for treating septic shock, conditionatory activities. The sind and actimum the conditionatory activities. The sind sequence represents a conditionation and variable to the human TNF mRNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunosuppressive; antirheumatic; antiarthritic; anti-HIV; antipsoriatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise ribonucleotides and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or chemically synthesised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New short interfering nucleic acid, useful e.g. for diagnosis of septic shock or rheumatoid arthritis, expression of the tumor necrosis factor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human tumour necrosis factor (TNF) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (RIBO-) RIBOZYME PHARM

The disease or condition may include pulmonary disease such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA target DNA of the invention.

                                                                                                                                                               useful for down-regulating the expression of an endogenous mammalian target gene and therefore in the treatment of any disease or condition that responds to modulation of gene expression or activity in a cell, tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                               The invention relates to a double-stranded short interfering nucleic acid (siNA) molecule that down-regulates expression of an endogenous mammalian target gene comprising one or more chemical modifications and each strand of the double-stranded siNA comprises about 21 nucleotides. The siNA of the invention demonstrates antiarteriosclerotic, neuroprotective,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Parkinson's disease, epilepsy, dementia, huntington's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a double-stranded short interfering nucleic (siNA) molecule that down-regulates expression of an endogenous mamma target gene comprising one or more chemical modifications and each stof the double-stranded siNA comprises about 21 nucleotides. The siNA of the double-stranded siNA comprises about 21 nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New double-stranded short interfering nucleic acid molecule, useful for down-regulating the expression of an endogenous mammalian target gene of treating diseases that respond to modulation of gene expression or

                                                                                                                                                                                                                                   The invention provides novel human 14171 protein kinase polypeptides and polynucleotides. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of a 14171 protein kinase such as cancer, immunological disorder, inflammation, heart failure, hypertension, atrial fibrillation, viral disorder and apoptotic disorder. The invention can also be used in chromosome mapping, tissue typing, predictive medicine, forensic biology and prognostic assays. The present sequence is small interfering RNA-DNA hybrid used to modulate the expression of human 14171 protein kinase. This sequence is used in the

                                                                                                                                                                                                                                                 The specification describes the use of a recombinant turkey herpes virus (CTHV) for production of live, recombinant avian vaccines, intended for vaccination in ovo, of day-old chicks, or of adults to protect against an CC avian pathogen. The recombinant THV includes at least one nucleic acid that encodes and expresses an antigen of the avian pathogen, inserted CC into intergene region 1, 2 or 3 of the BamHI fragment of the THV genome. CC The nucleic acid especially encodes the VP2, VP3 or a combination of VP2, CC 3 and 4, from infectious bursal disease (Gumboro disease) virus; 9B, 9C, CC gD or 9H plus 9L of Marek disease or infectious laryngotracheitis viruses (F or NH of NewCastle disease virus; S or M of infectious bronchitis (CMV-IE) promoter (human or murine), or the Marek RNA1.8 promoter (especially used in combination with CMV-IE for increased levels of CC expression). The recombinant viruses of the invention are used to vaccinate chickens against one or more of the viruses that cause Gumboro (infectious bursal), Marek or NewCastle diseases, infectious bronchitis, CC infectious bursal), Marek or NewCastle diseases, infectious bronchitis, CC fire THV genome. The amplified fragment was used to construct a plasmid CC comprising intergenic region 1, which was used to produce recombinant CCC viruses of the invention are combinant CCC viruses of the invention.

                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                The invention relates to a pharmaceutical composition comprising a PRL-1 CC homologous protein or/and its functional fragment, a nucleic acid composure protein and/or a modulator/effector of the nucleic cc composition is useful for the manufacture of an agent for detecting cor/and verifying, for the treatment, alleviation and/or prevention of carpand verifying, for the treatment, alleviation and/or prevention of carpand diabetes, as well as related disorders such as eating disorder, cc cachexia, hypertension, coronary heart disease, hypercholesterolemia, cc dyslipidemia, osteoarthritis, gallstones, or liver fibrosis, in cells, cc cell masses, organs and/or subjects in vivo or in vitro. The nucleic acid cmolecule and polypeptide are useful for the manufacture of a medicament cc controlling the function of a gene or/and metabolic syndrome for controlling the function of a gene or/and a gene product, which is cinfluenced or/and modified by a pRL-1 homologous polypeptide, and for the production of a non-human transgenic animal complete to detect amplification of the mouse protein tyrosine phosphatase trype IVA member 3 i.e. Prl-3 gene for gene expression analysis.
                                                                                                                                                                                                                   Query Match

CC The invention relates to a kit for diagnosing and treating T-cell CC associated diseases which comprises a panel of nucleic acid primers CC specifically priming and allowing amplification of each Vbeta gene, CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant Crejection and diagnosing and treating T-cell associated diseases CC including autoimmune diseases, degenerative nervous system diseases, infectious diseases, CC graft versus host diseases, hypersensitivity diseases, infectious diseases, CC and neoplastic diseases. Autoimmune diseases include Addison's diseases, attoinmune diseases include Addison's diseases, CC and neoplastic diseases. Begenerative nervous system diseases include Type CC atrophic gastritis. Degenerative nervous system diseases include Type CC injuries such as contact with allergens that lead to CC allergies, Type II hypersensitivities such as those present in CC Goodpasture's syndrome and Type IV hypersensitivities such as those caused by CC manifested in leprosy. Infectious diseases include viral infections CC caused by Viruses such as Infections such as those caused by CC the yeast genus Candida, parasitic infections such as those caused by CC schistosomes, filaria and bacterial infections such as those caused by CC schistosomes, filaria and bacterial infections such as those caused by CC such as leukaemias, lymphomas and cancers such as cancer of the brain, CC breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                  Matches
                                                                                                                                 Query Match

                                                                   including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HTV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by hycobacterium. Neoplastic diseases include Type properties and the properties of the hypersensity such as those caused by hycobacterium. Neoplastic diseases include Type properties and the properties of the hypersensity diseases include the properties of the hypersensity diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human; T-cell associated disease; graft versus host disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; disease; multiple sclerosis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome;
                                                                                                                                                                                                                                                                                                                                      associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a kit for diagnosing and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

              CC associated diseases which comprises a panel of nucleic acid primers CC specifically priming and allowing amplification of each vheta gene, perifically priming and allowing amplification of each vheta gene, where years are consisted diseases and consisted diseases and consisted diseases and consisted diseases, concluding autoimmune diseases, degenerative nervous system diseases, consisted diseases, page-resensitivity diseases, infectious diseases, consisted diseases, attributed diseases, and page-resensitivity diseases include multiple arrows gastritis. Degenerative nervous system diseases include multiple collections and Alzheimer's disease. Hypersensitivity diseases include Type CC Intropic gastritities such as contact with allergens that lead to confect of the person of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Addison's disease; atrophic gastritis; degenerative nervous system disease; multiple sclerosis; degenerative nervous system disease; type I hypersensitivity disease; type I hypersensitivity disease; type II hypersensitivity; Goodpasture's syndrome; allergy; type II hypersensitivity; leprosy; infectious disease; viral infection; type IV hypersensitivity; leprosy; infectious disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer;

                                                                                                 Ş
                                                                                                                                                                                                      The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the HER CC promoter duplex between positions -65 to -380 which contains a purine-crick region concentrated on one chain of the duplex. The oligomer, and cothers like it are useful in diagnosis and therapy of diseases cc characterised by specific DNA duplex targets, e.g. cytomegalovirus; HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The criticle helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer cc may contain an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3 positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modification may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on cc.

These sequences could be used as probes to detect the presence of a particular double stranded (ds) nucleotide sequence. They can also be used to prevent the expression or function of a selected ds sequence. They can be used in the development of antibacterial, anticancer and antiviral agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligomers comprising purine base analogues - used to identify or prevent expression or function of nucleic acid by triple helix formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Target; T7; expression;

The sequences given in AAQ38289-91 were used to form triple helices wit a target T7 Psoralen-derivatised MP-oligomer (see also AAQ38288). These sequences could be used as probbs to detect the presence of a particula double stranded (ds) nucleotide sequence. They can also be used to prevent the expression or function of a selected ds sequence. They can used in the development of antibacterial, anticancer and antiviral agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligomers comprising purine base analogues - used to identify or prevent expression or function of nucleic acid by triple helix formation.

                                                                                                                                                                                                                                                                                                                              oligomers") and complementary ribooligonucleosides ("RNA oligomers") were examined for their ability to form triple helix complexes. (Set 1:G2100 and R39; Set 2:G2101 and R289; Set 3:G2106 and R84 see AAQ68229-34). It was shown that all-purine MP oligomers contg. a 50:50 mixt. of adenines and guanines are capable of forming 2:1 MP:RNA triple stranded complexes with their complementary RNA oligomers.                       Oligomers AAV54880-83 were purified using the method of the invention. The specification describes a new process is for separating an oligomer with a selected nucleoside sequence from impurity oligomers with different sequences. It comprises normal phase column chromatography on a column with polyhydroxyethyl aspartamide, silica or hydrophobic silica as the support, where the hydrophobic silica has its silica component modified with an uncharged hydroxylated hydrophillic moiety other than cyclodextrin, including separation conditions so that the oligomer has a different retention time on the column than the impure one, provided that the desired oligomer differs from the impurity in nucleoside sequence by other than a thymine or uracil base. The method is used for the purification of desired oligomers from impurity oligomers based on properties that are incorporated into the desired oligomers duting their manufacture. Purified oligomers can be used as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligomer purification using normal phase column chromatography separates the desired oligomers from impurity ones, based on g characteristics of the desired oligomers introduced during the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       was shown that all-purine MP oligomers contg. a 50:50 mixt. of and guanines are capable of forming 2:1 MP:RNA triple stranded with their complementary RNA oligomers. (Updated on 25-MAR-2003 correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligomer Genta 3 purified using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 16

                                                                                                                                The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers. Rp chirally enriched synthetic oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AXX91054-75 represent oligomers chemically synthesised using
                                                                                                                                                                                                                                                                                                                                      Oligomers made using chirally pure nucleoside dimers, trimers, tetramers with enhanced binding affinities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 16

                                                                                                                                                                                                                                                                                                                                                                target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers. Rp chirally enriched synthetic oligomers.
                                                                                                                                                                                                                                                                                                             synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AAX91054-75 represent oligomers chemically synthesised using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligomers made using chirally pure nucleoside dimers, tetramers with enhanced binding affinities.

                                                                                                                                                                                                                                                                    ş
                                                                                                                                                                                                                                                                                                                                                               The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and containing SSRs, a library of ryegrass or fescue genomic DNA enriched by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR aprepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing varieties and testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the semence is a vaccrase or fercus and or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                 Query Match

The electrical resistance of the electrode surface is reduced, i.e. conductivity is improved. This sequence represents a nucleic acid fragment used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method of preparing an electrode coated with biomolecules (I), comprising preparing a composite of electrically conductive material (A) bound with a plastic, and treating this with a solution containing (I) so that this binds to the surface of the plastic. The electrodes are used for concentration of additional biomolecules (especially RNA or DNA), having affinity for (I), from a sample solution, and for quantitative electrochemical detection of biomolecules. A predefined combination of promiscuous probes is capable of hybridising to target sequences of at least one target polynucleotide, wherein said predefined combination of probes provide specificity of detection of that target polynucleotide. The probes of the invention are useful for detecting a number of different target polynucleotides using a programmable digital computer or for detecting an unknown or uncharacterised number of a polynucleotide family. The present sequence is potyvirus polymerase B motif encoding DNA used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           methods for detecting several different target polynucleotides. The set comprises a collection of different promiscuous probes each of which is capable of hybridising to a target sequence shared between at least two

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                       17 is a field.)
                                 The inventors claim a method of transporting a nucleic acid deriv. accross a membrane which comprises using a receptor that uses salt bridgin, aromatic stacking, H bonding and chelation to recognise the nucleic acid deriv. AAQ56305, AAQ58577-86 are nucleic acid derivs used in the examples. Nucleotides 1-16 of AAQ58577 are ribonucleotides and nucleotide 17 is a deoxyribonucleotide. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                  The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages. Sequences AAX91054-75 represent oligomers chemically synthesised using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligomers made using chirally pure nucleoside tetramers with enhanced binding affinities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligomer prepared using 2'-O Methyl MP(Rp)/2'-O Methyl MP dimer
                                                                                                                                                                                                                                                                                                             Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or tetramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers. Rp chirality enriched to a complementary to an RNA target sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                  providing chirally enriched synthetic oligomers. Rp chirally enriched synthetic oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligomers made using chirally pure nucleoside tetramers with enhanced binding affinities.
                                                                                                     Human
                                                                                                                                   29-MAY-2002

                                                                 RESULT 1241
                                                                                                                                                                                                                                                                                          The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 cc used as immunogens to raise antibodies that specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as thardards in assays used to determine the concentration capture probes for surface-enhanced laser desorption ionisation, as tharped to replacement in patients having specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 corpoduction, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 mGDMLP-1 in particular heart corpoduction and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

CC The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed capture of the printed in electronic format directly from WIPO capture proteins obtained in electronic format directly from WIPO
                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as
therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gu Y,

nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                New polypeptide, for raisin
or as specific biomolecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; parcreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; florouracil carboplatin; edatrexate; gemecitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn; s disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss.
                                                 The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat the inventor of the configuration. The enzymatic nucleic acid molecule is adapted to treat the inventor of the configuration.
                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecules which down regulates exp
a sequence encoding a subunit of nuclear factor kappa B useful
treating cancer, inflammatory disorders and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chips. The nucleic acid sequences of the invention can be therapy. This polynucleotide sequence represents a tumour related human fukutin oligonucleotide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cc cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or CC multidrug resistant cancer. The method involves use of other drug CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, CC cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, CC cacid molecules are also useful for treating inflammatory disease such as CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft CC rejection, gene therapy applications, ischaemia/reperfusion injury CC (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammatin, inflammatory bowel disease or CC infection. This sequence represents the substrate of a novel enzymatic CC nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

human immunodeficience acid molecule of the

immunodeficiency virus (HIV)

es to a novel short interfering RNA (siRNA) nucleic enzymatic nucleic acid molecule, that modulates leiz enzymatic nucleic acid molecule, K-Ras, H-Ras, N-Racleic acid molecule encoding HER2, K-Ras, H-Ras, N-Racy virus (HIV) or a component of HIV. The nucleic invention has cytostatic, anti-HIV, and anti-

N-Ras,

acid molecule or an enzy expression of a nucleic

invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ព្រះព្រះព្រះជន
                       The invention relates to the isolation of 6327 nucleotide sequences, of fragments of at least 180% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides encoded polypeptides and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis also the used for confer for their provinces and polypeptides can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                      for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR) IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating; cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target type and as a diagnostic tool to examine genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase oprotein kinase PKR genes, for treating cancer and inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-APR-2001; 2001US-00827395

The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor (PTGDR), it has neurite growth inhibitor, NGGO, prostaglandin D2 receptor (PTGDR), it has been considered in the function of a receptor (PTGDR), it has been considered in the function are useful for treating; cerebrovascular accident, central rervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, inflammatory disease (e.g. rheumatoid arthritis, it restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, is conditions (e.g. asthma, allergic rhintis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic cold drifts and mutations within diseased cells or to detect the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                05-APR-2001;
29-MAY-2001;
28-AUG-2001;
The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, nultiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; dlabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; Human IKK-gamma.
                                                                                                                                                                                                                                                         Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

                                                                                                                                  The sequences given in AAT49874-75 are primers which were used in the amplification of rat Syk kinase mRNA. Sequences antisense to the Syk kinase mRNA, Sequences antisense to the Syk kinase mRNA, were used to reduce phagocytosis of immune complexes in a mammal by introducing into phagocytic cells an inhibitor of an endogenous kinase associated with an Fc receptor on the cell membrane. Inhibition of phagocytosis modulates clearance of antibody-coated cells and immune complexes, so reduces or prevents regional tissue damage caused by monocyte or neutrophil activation, i.e. for treatment of immune object aldisease, e.g. autoimmune disease, caused by reaction of immune complexes and an Fc receptor, and immune discretes such as asthma. Sequences encoding the inhibitor may be introduced ex vivo and the cells then
                                                                                                                                                                                                                                                                                                                                      Inhibiting phagocytosis or immune comcods. that inhibit endogenous kinase receptors on the cell membrane, for t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a PCR primer used in distinguishing fertility recovery properties in rice. The presence of codominant DNA marker for a gene encoding a fertility recovery in rice gene is confirmed by a PCR. A primer prepared from the rice DNA as a template is used in the PCR analysis to characterise the genotype of the gene for rice the PCR analysis to characterise the genotype of the gene for rice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Distinguishing fertility recovery property in rice marker confirmed by polymerase chain reaction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a PCR primer for rat Syk kinase. The invention relates to a method for inhibiting the signal transduction of the gamm subunit of the IgE receptor Fc epsilon RI, using a peptide inhibitor, an antisense construct. The invention also relates to a method of inhibiting the release of a mediator from a Syk-producing cell of a mammal, and a method of inhibiting the phagocytic potential of a mammalian cell expressing an Fc receptor. The methods are useful for modulating the activation of immunological processes involving Fc
  New molecular marker for a gene determining fructose:glucose ratio mature tomatoes - useful for finding this gene and producing tomato seeds, plants and/or fruit with an increased fructose to glucose ra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC fructose glucose ratio in mature tomatoes. Also described are: (1)

CC breeding tomato plants that produce tomatoes having superior taste

CC characteristics. At least one Lycopersion esculentum plant is crossed

CC with a Lycopersion spp. to produce hybrid [71] seeds, which grow into Fl

CC plants that produce seeds. These seeds produce plants, which produce ripe

CC fruit, in which the fructose glucose content is determined using the

CC marker gene; and (2) tomato plants produced by the method, and their

CC fruit and seeds. The marker is useful for finding (and cloning) genes

CC gene is also useful in a method of breeding tomato plants for selecting

CC plants producing fruit having desired characteristics. The marker

CC fructose glucose ratio than that of standard L. esculetum. The molecular

CC marker enables the selection of tomato plants at the young seedling

CC marker enables the selection of tomato plants at the young seedling

CC phenotype, which can limit the effectiveness of selection for a phenotype

CC characteristic. The present sequence represents a primer used in
